QA Engineer

Web, Mobile & AI

Remote

About us

We're building an AI platform for short-term rental hosts and property managers. It handles guest communication, automates operational workflows, and coordinates the people who keep properties running, from upsells to cleaning dispatch. We're a small team getting ready for launch, and we know that quality is what makes an AI product trustworthy.

The role

You'll own quality across our product's critical workflows, from test planning through post-deployment checks. Working closely with Product and Engineering, you'll prioritize testing by risk and by the dependencies between modules, and you'll help make sure our AI assistant gives answers that are accurate, grounded, and safe.

What you'll do

- **Design test cases.** Turn acceptance criteria into test cases with preconditions, test data, steps, and expected results. Cover positive, negative, and boundary cases, and maintain the regression suite.
- **Test the web app.** Run end-to-end workflow tests and regression checks, and verify consistency across the dashboard, reports, and exports.
- **Test the mobile app.** Test across supported devices and OS versions, checking layout, navigation, sessions, and recovery after a network interruption.
- **Test our AI.** Build and maintain a reusable set of French and English test prompts with reference answers. Check factual accuracy, grounding in our product data, and handling of ambiguous or unsupported requests. Rerun the set after any prompt, model, or data change.
- **Engineer prompts.** Write and refine prompts with clear instructions, context, and output constraints. Compare prompt versions on the same test set, document failures, and propose improvements to Product and Engineering.
- **Test functional security.** Verify permissions by role and property, direct links, exports, and conversation isolation. Test whether prompts can override instructions or expose restricted data.

What you bring

- **Test design and execution.** You prepare and run test cases, choose the right browsers and devices, and select regression tests based on risk.
- **AI testing and prompt design.** You design prompt variants and score responses against expected facts, source data, and access rules. You reproduce failures by recording the prompt, version, and test context.
- **QA reporting.** You write clear bug reports in English with everything needed (steps to reproduce, priority, and so on), retest fixes and dependent modules, give a QA release recommendation, and verify the deployed build.

Nice to have

- Test automation with Playwright, or Appium for mobile
- Familiarity with Git and CI pipelines
- Experience with AI assistants

Why join

- Shape QA practices from the ground up on a product heading to launch
- Work where classic QA meets AI evaluation and prompt engineering
- Have a direct say in what ships, alongside a small, hands-on team

How to apply

Send us your CV and a few lines on why this role fits you.
